

Europe Match GmbH environment protection policy

Europe Match production facility is focusing the following activities to fulfill all requirements of EU (Hungarian) regulations and keep highest level of environment protection:

1. Air

Boiler is equipped with an afterburner to burn the smoke inside the boiler. The remaining smoke is filtered by a 55pcs sack dust filter before the chimney. The output is checked by accredited laboratory and controlled by environmental authority.

Self-control is made yearly.

Every quarter + yearend a report is handed in to the environmental authority about the output materials.

2. Water

The company uses water from its own well under strict authority volume control to protect our water resources. Every quarter + yearend we report the consumption.

Waste water is separated to 2 directions: communal waste water is directly connected to the city waste water system, but the waste water from the production technology is collected and cleaned in our own the waste water treating unit before letting the cleaned water out to enter the city system. This water is checked by accredited laboratory every quarter, and results are reported to the authorities.

Remaining waste water mud is handled as dangerous waste and is transported by accredited company.

3. Waste

The company runs a waste handling plan to reduce the waste output during its activity.

Communal waste is collected selectively: paper, plastic, metal, mixed

Paper waste is sold to recycling company with permission.

We report the waste amounts to the authority yearly.

Dangerous waste and industrial waste is selected and documentation is updated daily.

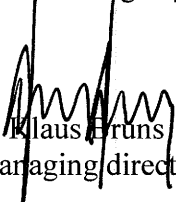

Report to authority every quarter + yearend.

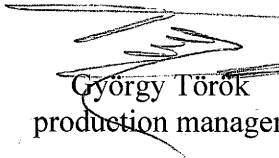

4. Finished products

EN 1783 standard

5. Training

Yearly training and education is done to all employees about sustainable development and environmental knowledge by outside (university) experts.
